

inReach Explorer, SE+ & Explorer+ Compatibility with GeoPro

Lu Parente - 2017-03-21 - in inReach Devices

The inReach Explorer, inReach SE+ and inReach Explorer+ are officially supported by GeoPro however there are some feature limitations related to how these devices interact with the GeoPro web app. The inReach Explorer, inReach SE+ and inReach Explorer+ support the same core features as the inReach SE when used in GeoPro, this includes:

- Text Messaging (Free-Form & Canned Messages)
- Preset Messages (Reserved to control Check-In Schedules or Monitoring Sessions)
- Tracking
- Contacts
- Mailbox Check
- Location Sharing
- SOS
- Sync

GeoPro does not support the ability to use Routes and will not post Waypoints created by device users to the GeoPro web app.

The inReach Explorer, inReach SE+ and inReach Explorer+ provide the capability to support most of their enhanced features locally on the device. These features include Map, Waypoints, Compass and Location. Below you will find a summary of how each of these features can be used locally on the device without having to interface with the GeoPro web app.

Map - The Map will display any previously transmitted text messages, track points, and SOS declarations as well as locally stored waypoints, and track logs. The map also provides the ability for device users to define new waypoints as well navigate to the location of any of the previously transmitted items listed above.

NOTICE: The inReach Explorer+ comes preloaded with topographic maps for North America and world base maps for the world. Downloading and syncing of topographic maps for the rest of the world are not supported by GeoPro at this time.

Waypoints - The Waypoints menu will allow device users to create new waypoints locally on their device based on their current location, navigate to any previously stored waypoints, as well as manage all existing waypoints on the device.

Compass - The Compass can be used to assist device users with navigating to any of the locally stored waypoints, locally stored track logs, as well as any of the previously transmitted points that appear on the

Map.

Location - The Location menu will allow device users to share their location with any recipients or other device users. When another GeoPro device users receives the message, the user can select the location coordinates and navigate to the sender's location by using the onboard Map and Compass features.

If you require further information on how the inReach Explorer, inReach SE+ and inReach Explorer+ can be used with GeoPro, please contact our Technical Support department.
