## Performing a Check-In using the GeoPro Mobile App

Lu Parente - 2018-07-11 - in [GeoPro Mobile App for iOS](#)

Performing a check-in is a simple task and a way of letting your employer or overseeing personnel know you're okay while working through your day to day operations. By checking-in when prompted, you're satisfying the GeoPro web app and preventing "overdue" notifications from being sent to designated contacts (and GEOS if enabled).

A check-in can be requested while Monitor Me is enabled, when a Check-In Schedule is active or when a web app Administrator or Monitor requests an ad-hoc check-in. With all types of check-in requests there is period of time that is granted to all you to check-in, prior to being flagged as "Overdue" and sending out event notifications to designated recipients.

The Check-In button can also be used at any time to send a check-in message to the GeoPro web app, even if one is not requested by the system.

This article explains how to perform a check-in using the GeoPro Mobile App.

1. From the home screen, simply press the **Check In** button to send a check-in message to the GeoPro web app.

**Note:** If the check-in button is pressed when prompted during an active monitoring session or check-in schedule, the timer will reset and display the next expected check-in.
