Performing a Check-In with the Alert Button using the GeoPro Mobile App

Lu Parente - 2018-07-11 - in GeoPro Mobile App for iOS

The GeoPro mobile app supports the ability to pair with VSN Mobil's V.BTTN alert button. The V.BTTN is a Bluetooth wearable button that can be used to surreptitiously trigger an SOS and perform a check-in from the GeoPro Mobile App without having to unlock your smartphone.

Visit the [VSN Mobil V.BTTN website](#) for device details.

Note: GeoPro Mobile App v2.4.2 or higher is required for V.BTTN support.

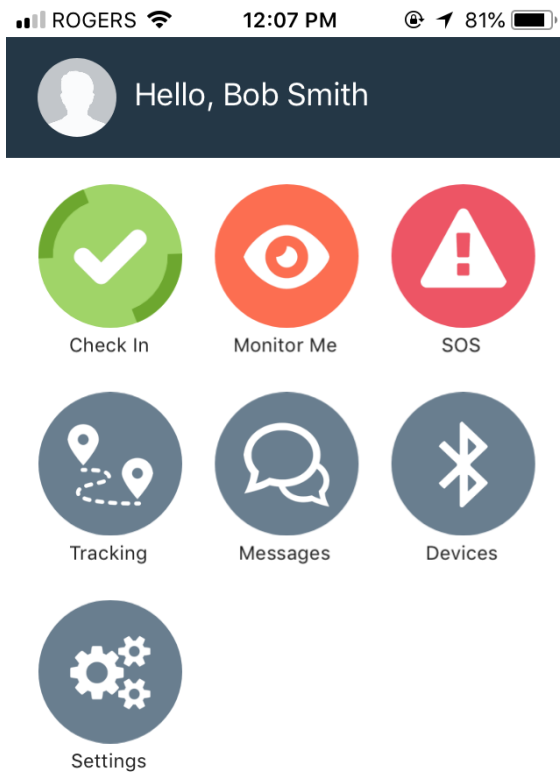

This article explains how to perform a check-in using the V.BTTN alert button. In order to use the alert button to perform a check-in, the "Check-in on short press" toggle must first be enabled in the Devices menu.

A check-in can be requested while Monitor Me is enabled, when a Check-In Schedule is active or when a web app Administrator or Monitor requests an ad-hoc check-in. A check-in can also be performed at any time to send a check-in message to the GeoPro web app, even if one has not been requested.

1. To send a check-in message, simply short press the alert button for a second or under.

2. The alert button will automatically send the Check-In message to the GeoPro Mobile App. The GeoPro Mobile App will then send the Check-In message along with the location details to the GeoPro Web App.

 **Check in complete**
Your check-in message has been delivered.
