## Placing Calls using Quick Call Buttons in the GeoPro Mobile

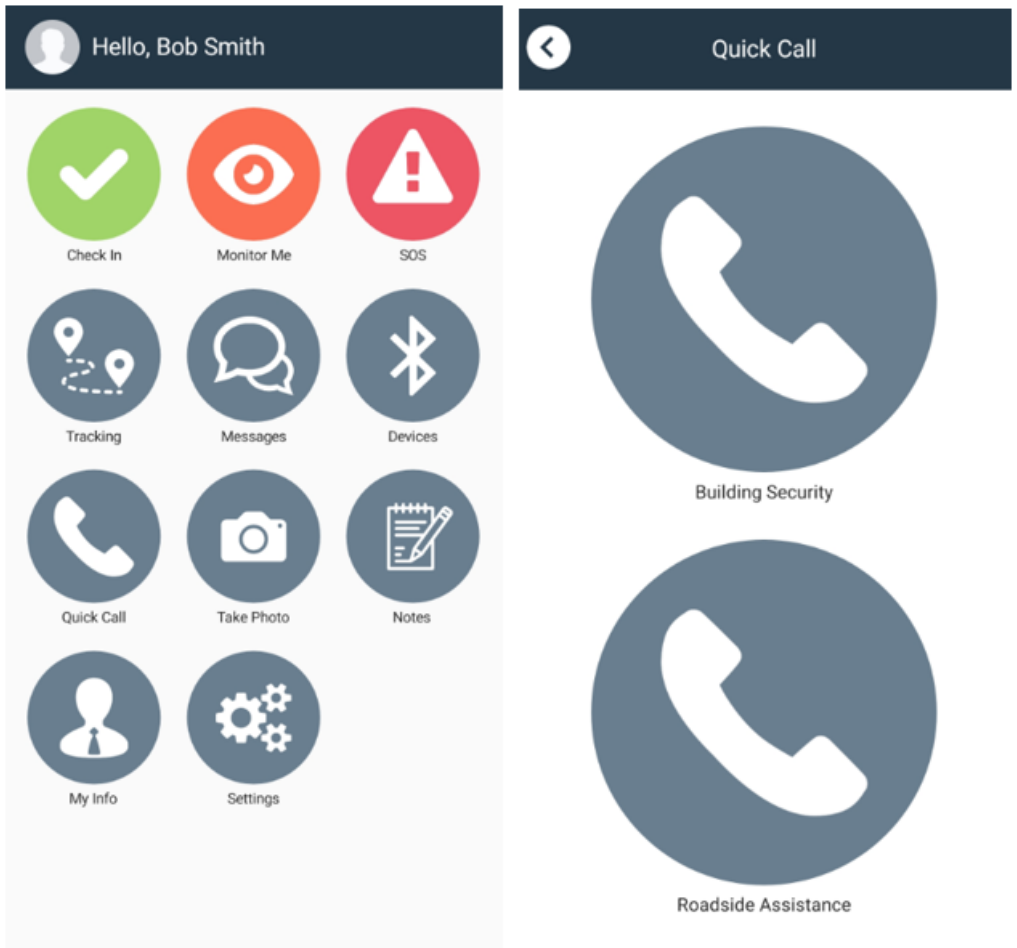

Gabor Jozsa - 2020-11-05 - in GeoPro Mobile App for iOS

Quick Call enables a GeoPro Mobile App User to rapidly place a phone call to one of two predefined phone numbers. These Quick Call options would be predefined by the account Administrator who can set what number is dialed when a button is pressed, and how that button is labeled.

Note: To use this feature the Mobile App User will need to have a mobile device with voice service (i.e. cellular voice); the Quick Call feature will not provide voice calling service to a device that does not already have this ability, instead it provides a means to access this ability quickly by dialing a predefined phone number.

To place a call using the Quick Call feature:

1. Tap the **Quick Call** button from the main menu
2. Tap the button for the call you would like to make.

3. The Mobile App User may be prompted by their mobile device's operating system to choose the app they would like to use to complete the call. If possible, it is recommended to set a default app for this action to reduce the steps required to make a call.
